

BUILDING A CHAMPIONSHIP IPL FRANCHISE

Unlocking 2018-2019 season trends with BigQuery SQL to isolate the hidden signals of structural consistency.

Consistency Is a Game Metric; **Stability Is Seasonal**

Most IPL analyses over-index on single-game peak performances, prompting teams to overpay for outlier players while ignoring Multi-Year baseline analytics.

Our core mission was to evaluate multi-year bat and ball metrics to identify:

- Tactical **All-Rounder Depth** and structure.
- Reliable **Innings Anchors** across consecutive years.
- Efficient **Run Prevention** under high pressure.

The Consistency Trap

Teams fail because they over-value peak single performances rather than structural multi-season reliability.

The Analytical Target

Evaluate exact multi-table relational joins over seasons to locate recurring defensive and offensive signals.

Business Strategy Value: Recruiter, I approach datasets by translating broad franchise questions into concrete, isolated metric queries.

Engineered Schema Pipelines in Google BigQuery

We utilized structured tables mapping individual player deliveries, matches, and aggregate scorelines across both the 2018 and 2019 IPL tournaments.

Table Structures Evaluated: Unified multi-table schemas mapping batsmen metrics and bowler statistics across seasons.

 **Data Quality Actions:** Resolving datatype conflicts across seasons (`STRING` vs `INTEGER` formatting) and standardizing player indexes.

STAGE 1: STANDARDISATION

Relinking table column mappings between matching batsman matrices.

STAGE 2: CO-JOIN QUERIES

Applying standard INNER JOIN keys mapped across years to extract players with active tenures.

Core SQL Competency: Mastered BigQuery SQL architecture, schema normalization, datatype casting, and indexing.

Kolkata & Mumbai Mapped Strategic Depth First

```
SELECT a.Player, a.Team FROM `men_IPL.2018_Bowlers` AS a INNER JOIN
`men_IPL.2018_Batsmen` AS b ON a.Player = b.Player;
```

BIGQUERY SQL

Executing relational co-joins on shared keys.

The Insight: Identifying true All-Rounders through Relational Joins. KKR and Mumbai fielded a core engine room of highly versatile players.

PLAYER	TEAM
Jadeja, R A	Chennai Super Kings
Narine, S P	Kolkata Knight Riders
Russell, A D	Kolkata Knight Riders
Pandya, H H	Mumbai Indians

Showing top entries. Full output table resolved from inner join.

 **Business Intelligence Integration:** Recruiter, I know how to extract strategic business definitions (e.g. defining "All-rounders") using SQL Joins on composite attributes.

The Toss Advantage Was **Weaker Than Hypothesized**

Many analysts treat winning the toss as a direct guarantee of success.

By executing aggregations (`COUNT`, `SUM`, and conditional `CASE WHEN` logic) over match statuses, the actual win percentage following a toss victory was isolated.

51.2%

Toss-Winner Match Win Rate

48.8%

Toss-Loser Match Win Rate

Data Skepticism: I don't follow assumptions; I validate prevailing franchise beliefs using hard aggregations.

K.L. Rahul & ABD Dominated **Batting** Consistency

To identify top performing run anchors over both seasons, we integrated multi-year batting metrics via joined aggregation keys.

```
SELECT a.Player, (a.`50s` + b.`50s`) AS TotalHalfCenturies FROM
`men_IPL.2018_Batsmen` AS a INNER JOIN `men_IPL.2019_Batsmen` AS b
ON a.Player = b.Player ORDER BY TotalHalfCenturies DESC LIMIT 3;
```

BIGQUERY SQL

Multi-season batting performance accumulation query.

Combined Seasons 50s Leaders:

Consolidated top results for combined season statistics.

SQL Highlight: Complex Multi-Table Addition, Inner Joins, and high performance sorting constraints (`ORDER BY DESC`).

Raw Wicket Count Hidden Defensive Match Winners

```
SELECT Player, Wkts, E_R FROM `men_IPL.2018_Bowlers` WHERE E_R < 7
ORDER BY Wkts DESC;
```

The Volume Paradox: Andrew Tye took 24 wickets (winning the Purple Cap) but ran high run-rates. By filtering with a conditional **WHERE E_R < 7**, we locate the actual anchors.

PLAYER	WKTS	E_R
Rashid Khan	21	6.74
Bumrah, J J	17	6.89
Mujeeb Ur Rahman	14	6.99
Ngidi, L	11	6.00

Reference database: High-efficiency bowling filters applied.

Analytical Refinement: Recruiter, I recognize that volume without efficiency represents a structural weakness in any sports or business asset.

Part-Time Utility Bowlers Preserved Strategic Assets

Crucial overs in defense are often secured by non-specialist resources. To identify those hidden metrics we queried bowlers with the least overs delivered.

```
SELECT Player, Overs FROM `men_IPL.2018_Bowlers` ORDER BY Overs ASC LIMIT 5;
```

Isolating underutilized match-winning secondary assets.

PLAYER	OVERS DELIVERED
Pathan, Y K	2.0
Short, D J M	3.0
Vinay Kumar, R	3.5
Asif, K M	6.0
Rana, N	6.1

Ranked results for short-spell supporting bowlers.

 **Unconventional Insights:** Isolate secondary and highly restricted assets to identify optimization levers.

| The Analytical Stack: **Tools & Strategies**

Core SQL Syntax

Expert in Relational Inner/Left Joins, Aliasing, Conditional filtering (WHERE/HAVING) and aggregated grouping strategies.

BigQuery Optimization

Proficient in executing fast analytic queries across normalized relational databases, handling diverse scale-based structures.

Business Translation

Translating sports performance parameters directly into actionable quantitative metrics to evaluate franchise consistency.

Why Hire Me: I merge rigorous pipeline querying with strong commercial and technical instincts.

| Let's Build Something **Data-Driven** Together!

I am **Aditi Paitandy**, a Business Intelligence & Data Analyst who builds structural visual data pipelines that support complex strategic decision systems.
